

1. What factors predict donation intention in charitable giving contexts?

2. Does warm-glow motivation explain charitable giving behavior?
3. How does trust in a nonprofit organization affect donation intention?
4. Is donor satisfaction a predictor of donor loyalty and repeat giving?
5. What is the role of organizational reputation in charitable donation behavior?
6. Does the Theory of Planned Behavior predict charitable donation intention?
7. How do credence goods characteristics of charities affect donor decision-making?
8. What motivates donors to give time versus money to nonprofits?
9. Does organizational identification predict donation intention in nonprofits?
10. How do fundraising appeals influence charitable giving behavior?

Donation Intention in Nonprofit Giving

Donation intention in charitable giving is mainly explained by **psychological drivers**, **organizational credibility cues**, and **appeal design**, while evidence on donor satisfaction and repeat giving is sparse in the supplied literature (White et al., 2023; Chapman et al., 2021). The evidence clusters into three facets: core predictors of intention, trust and reputation under nonprofit uncertainty, and differences across motives, donation types, and fundraising appeals (Benli & Kocaman, 2025; Robson & Hart, 2020).

Core Predictors

Across studies, donation intention is most consistently predicted by TPB variables, moral norms, past behavior, and identification, with some variation by context and donation channel (White et al., 2023; Mittelman & Rojas-Méndez, 2018).

- **Perceived behavioral control** is the strongest TPB predictor in meta-analysis, with $r = 0.562$ for intention (White et al., 2023).
- TPB predictors explain **44% of intention variance**, rising to 52% when moral norm is added (White et al., 2023).
- In nonprofit-specific samples, attitudes, subjective norms, perceived control, past behavior, and **brand identification** all predict donation intention, although altruism and self-esteem are not always significant (Lee & Kim, 2023; Millán et al., 2023; Kim & Han, 2020).

Trust and Reputation

Trust and reputation matter because charities are hard to evaluate directly, so donors rely on organizational signals to reduce uncertainty (Chapman et al., 2021; Ghoorah et al., 2021). The strongest evidence shows a positive but moderate trust–giving relationship, and reputational cues often work partly by building trust (Chapman et al., 2021; Ghoorah et al., 2021).

- Trust is **positively associated** with giving overall, with meta-analytic $r = .22$; organizational trust is stronger than generalized trust (Chapman et al., 2021).
- In charitable organization studies, perceived ability, integrity, and benevolence all positively influence donation attitudes or intention (Lee & Kim, 2023; Li et al., 2022).
- Reputation shapes donation intention directly and indirectly: CEO reputation changes which TPB predictors matter, and decision-useful financial disclosures improve perceived reputation, then trust, then intention (Kim & Han, 2020; Ghoorah et al., 2021).

Motives and Appeals

Warm glow, giving form, and fundraising context all influence donor behavior, so money, time, and crowdfunding donations do not respond to the same cues (Benli & Kocaman, 2025; Chen et al., 2019).

- **Warm glow** appears important but not sufficient: it was the strongest driver in one donor survey, yet field and fundraising studies indicate it operates alongside altruism, trust, identity, and other motives (Amonhaemanon et al., 2024; Carpenter, 2021; Chapman et al., 2021).
- Time and money giving differ: time donations are more emotional and social, while money donations are more utility-oriented; in crowdfunding, time intention was predicted by social presence, trust, and control, whereas subjective norm was insignificant for money intention (Chen et al., 2019).
- Fundraising appeals change giving: self-benefit or warm-glow appeals increased giving likelihood by **6.6%** and donation amount by **23%**, while recipient-benefit appeals showed no significant average effect; persuasive project text also predicts crowdfunding donation intention (List et al., 2021; Li et al., 2022).

Overall, **donation intention in nonprofits is predictably shaped by TPB cognitions, trust, reputation, identification, and appeal framing**. The supplied papers give little direct evidence on **donor satisfaction as a predictor of loyalty or repeat giving**, and they address credence-good dynamics mostly indirectly through trust, disclosure, and reputation rather than with a standardized credence-goods model.
