Abstract

Purpose – The purpose of this paper is to: distinguish between financial brand equity and perceptual brand equity; distinguish among different stakeholder perspectives on customer-based brand equity, consumer-based brand equity (CBBE) (consumer, customer, employee and resident); contrast the original definitions and measures of CBBE by Aaker and Keller; identify the deviations from the original conceptualizations and measures of CBBE by Aaker and Keller; discuss the evolution of the most commonly used CBBE components; analyze the structural relations of the most common CBBE components and generate conceptual, structural, relational and methodological suggestions for future research.

Design/methodology/approach – This critical review conducted a narrative analysis of the perceptual brand equity literature (CBBE) by inventorying about 200 empirical and conceptual CBBE studies in several different contexts. Studies that included CBBE, brand equity, customer-based brand equity and consumer-based brand equity were included in this review. Only 87 representative studies that either conceptually defined or empirically measured CBBE and its components were included in the deep analysis.

Findings – The review revealed that the literature is divergent in terms of CBBE components or structural relations among components in any context including tourism and hospitality. Even though about 40 different CBBE components exist in different contexts, the totality of the CBBE literature reflects a consensus on five components of CBBE, brand familiarity/brand awareness, brand image/brand associations, perceived quality, consumer value and brand loyalty, all of which collectively define the total meanings of a brand from consumer/customer perspective.

Research limitations/implications – Keeping these five components intact, this study suggests a concise CBBE definition, conceptual clarifications for these components, a model reflecting their structural relations and a framework of parsimonious measures. The study makes future research recommendations in terms of using uniform CBBE components, measures and relational structure among components, identifying the relationship between CBBE and financial-based brand equity and comparing different stakeholder perspectives on CBBE in future research.

Originality/value – With these observations and suggestions, this critical review provides a guideline for more robust theory development of the CBBE construct. Additionally, it offers a parsimonious and practical CBBE blueprint for the practitioners who include CBBE as a strategic market metric in their marketing and research plans. Furthermore, it suggests standardization in CBBE research to enable systematic reviews with meta-analysis of the CBBE literature in the future. Using standard components, measures and relational models in CBBE research, as was suggested in this study, would allow meta-analysis for a meaningful comparison of results between different brands, products and even industries.

Keywords Brand equity, CBBE, Brand loyalty, Brand image, Consumer value, Perceived quality

Introduction

Brand equity is considered a critical indicator of a brand's financial success, hence, has received academic and practitioner attention for about three decades, which is reflected in the sheer volume of research. It has been defined and measured in many different ways depending on the perspective taken on the brand. These different perspectives can be grouped into two general categories, namely, financial-based brand equity (FBBE) and perception-based brand equity (CBBE). Earlier studies on brand equity were more focused on the financial-based indicators or market behavior of the firm such as cash flows, cost savings, sales and prices (Blattberg and Wisniewski, 1989; Farquhar, 1989; Kamakura and Russell, 1993; Swait *et al.*, 1993; Wentz, 1989; Yovovich, 1988). Some of these early studies used brand equity and brand value interchangeably, as they equated brand equity to the total worth of a firm (Kamakura and Russell, 1993; Wentz, 1989; Yovovich, 1988). Overall, the literature indicates that successfully branded products have better consumer perceptions and a long term competitive advantage over unbranded products through price premiums (actual prices), higher market shares, shareholder values, cash flows, revenues, profits and lower costs and price elasticities, (Blattberg and Wisniewski, 1989; Doyle, 2001; Keller and Lehmann, 2003; Murphy, 1989; Swait *et al.*, 1993; Vazquez *et al.*, 2002; Yovovich, 1988). Thus, in the 90s, perception-based indicators, from perspectives of consumers, customers and employees, started receiving attention.

The foundation of the CBBE framework was set by the general marketing researchers Aaker (1991, 1996) and Keller (1993, 2003), who delineated CBBE as a conglomerate construct inclusive of several cognitive, affective and conative responses of consumers as a result of the branding activities of a firm. The potential of CBBE's influence on FBBE fueled ample attention into perception-based measures of brand equity (Christodoulides and de Chernatony, 2010; Kandampully *et al.*, 2018; Keller, 1993; Keller and Brexendorf, 2019; Lassar *et al.*, 1995). Aaker's (1991, 1996) and Keller's (1993, 2003) definitions and measures have been applied in several product contexts including hospitality and tourism products (destinations, hotels, events and restaurants). However, the literature shows different practices in terms of the components and measurements of CBBE, as well as the relational structure of its components.

Some researchers conducted literature reviews on CBBE or its components individually and made recommendations. For example, Christodoulides and de Chernatony (2010) focused on direct and indirect measures of CBBE, based on studies until 2009. On the other hand, Tasci (2016a) delved into the consumer value as a component of CBBE rather than analyzing CBBE in its entirety. The CBBE research gained momentum in the past decade especially in tourism and hospitality, showing persisting divergences in conceptualization and measurement of CBBE, calling for critical analysis and reconstruction of the CBBE framework by clarifying conceptual and methodological issues and suggesting more standard measures for future research. The current study aims to achieve this goal by providing critical analysis and synthesis of the CBBE literature. Thus, many different studies of CBBE in different contexts are included in this critical review to capture the original and evolved nature of CBBE. The specific objectives of this critical review are:

- distinguish between FBBE and CBBE;
- distinguish among different stakeholder perspectives on CBBE (consumer, customer, employee, resident);
- contrast the original definitions and measures of CBBE by Aaker and Keller;
- identify the deviations from the original conceptualizations and measures of CBBE by Aaker and Keller;

- discuss the evolution of the most commonly used CBBE components;
- analyze the structural relations of the most common CBBE components; and
- generate conceptual, structural, relational and methodological suggestions for future research in terms of using uniform CBBE components, measures and relational structure among components, identifying the relationship between CBBE and FBBE and comparing different stakeholder perspectives on CBBE in future research.

As brand equity definition and measurements in the marketing field and general business fields eventually influenced CBBE studies in multidisciplinary contexts including hospitality and tourism, these five objectives are anchored onto the original works, followed by comparing developments in tourism and hospitality. The specific characteristics and rationale of this critical review are explained below.

Method

The purpose of this review is not to find new facts or findings but digest, sift, classify and synthesize the facts and findings of past research (Manten, 1973, p. 75). Thus, this critical review is conducted with a narrative review where logical reasoning is used to analyze and synthesize past research. Using Cooper's (1988), *Taxonomy of Literature Reviews*, the characteristics of this review can be captured in six distinctions:

- (1) *The Focus* of this review is the CBBE theory as reflected in the methods and findings of past research.
- (2) *The Goal* of this review is criticism or to "critically analyze the existing literature" (Cooper et al., 2019, p. 5) by comparing the treatment of the CBBE construct in different studies to those of the originating works of Aaker and Keller.
- (3) *The Perspective* is pivoted on the original CBBE theory as suggested by Aaker and Keller to identify the development with consistency or divergence.
- (4) *The Coverage* is representative, as a representative body of literature was identified and included in the review to show both consistency and divergence in the development of CBBE. A critical review requires a comprehensive analysis of literature including the originating field and others that adopted it. CBBE is a concept designed and popularized by the foundational studies of Aaker and Keller in marketing and evolved by its applications in diverse industries including the tourism and hospitality industry, with its hotel, destination, restaurant and event contexts. The included "exemplars [...] are descriptive of many other works" (Cooper et al., 2019, p. 6) in different fields to identify the contextual differences reflected in the CBBE construct.
- (5) *The Organization* of the review is historical, as well as conceptual and methodological; where the CBBE concept is introduced chronologically, with the original works of Aaker and Keller followed by the studies listed chronologically in a table reflecting both the conceptual and methodological comparison of CBBE to those original works.
- (6) *The Audience* is both the scholars who investigate CBBE or its components, as well as those practitioners who use CBBE as a metric in their marketing research and plans.

This study searched for manuscripts that discussed CBBE by using popular scholarly work databases including ProQuest, EBSCOhost, JSTOR, Web of Science, Science Direct and GoogleScholar, inclusive of all journals. For effective search results, the search was

conducted with four keywords, namely, brand equity, CBBE, customer-based brand equity and consumer-based brand equity; those articles that included these keywords in their title, keywords, abstract or the text were included in the output. Even though thousands of entries appeared on the initial output, only the articles that discussed or measured the CBBE construct were retained for deeper analysis.

Articles that mentioned any of the keywords haphazardly without a deep discussion or measurement were excluded. Even though some seminal articles that defined some components of CBBE such as consumer value, perceived quality and brand loyalty that emerged before CBBE were also included in discussing these components, they were excluded in the CBBE analysis table (Table 1). Additionally, some studies that investigated the relationships among one or more of the CBBE components without using CBBE as a framework were included in discussing these components, but they were excluded in the CBBE analysis table (Table 1) (Baker and Crompton, 2000; Campo-Martinez and Garau-Vadell, 2010; Chen and Chen, 2010; Chen and Tsai, 2008; Chi and Qu, 2007; Gallarza and Saura, 2006; Kim and Brown, 2012; Williams and Soutar, 2009; Yoon and Uysal, 2005; Yuksel *et al.*, 2009). The final list of articles that were analyzed to discuss CBBE and its components included about 200 studies that were most relevant to the scope of the current study; 87 of these studies that either conceptually defined or empirically measured CBBE and its components were included in the CBBE analysis table (Table 1).

The resultant CBBE analysis table (Table 1) reflects original works of Aaker and Keller, early articles in general marketing and business literature, followed by studies in tourism and hospitality context, which gained momentum later as the concept was tested in the hotel, restaurant and destination contexts. Therefore, the journals include a wide variety of business, marketing, service marketing, hospitality and tourism. The following section addresses the study objectives first by analyzing the original works introducing the definitions, components and measures of CBBE, followed by the conceptual and methodological progress of brand equity and its components in other fields including tourism and hospitality, ending with synthesis and suggestions for a robust theory development of CBBE.

Analysis and synthesis of the literature

Objective 1: financial brand equity versus perceptual brand equity

Although conceptualization of brand equity with perceptual or financial metrics started in the late 80 s (Barwise *et al.*, 1990; Blattberg and Wisniewski, 1989; Farquhar, 1989; Tauber, 1988; Wentz, 1989; Yovovich, 1988), brand equity measures, especially with perceptual indicators, crystalized in the first half of the 90 s, initiated by the influential studies of Aaker (1991, 1992, 1996) and Keller (1993). Figure 1 displays perspectives with different measures that this area of

Figure 1.
Different
perspectives,
indicators, and
components used to
measure brand equity

Note: Author’s assessment based on the literature

inquiry has revealed in the literature, thus far. Earlier studies focused on financial-based brand equity with financial metrics such as cash flows, cost savings, sales and prices (Farquhar, 1989; Kamakura and Russell, 1993; Swait *et al.*, 1993; Wentz, 1989). Afterward, the focus shifted to the perception-based brand equity with perceptual metrics such as awareness, image, perceived quality, perceived value and loyalty (Aaker, 1991, 1992, 1996; Keller, 1993, 2003; King and Grace, 2009; Lassar *et al.*, 1995; Netemeyer *et al.*, 2004). The perception-based brand equity was also identified by different measures, including indirect measures focusing on cognitive metrics (Aaker, 1991, 1992, 1996; Keller, 1993, 2003) or direct measures focusing on economic metrics such as the willingness to pay higher prices (Ailawadi *et al.*, 2003; Barwise *et al.*, 1990). Although there is an ample amount of studies on FBBE and CBBE separately, there is a lack of studies combining the two. A recent study by Tasci (2020) attempted to compare several city-level tourist destinations on financial and perceptual equity indicators; however, the lack of comparable data limited the level of statistics for robust findings, hence the need for relating financial equity to perceptual equity awaits future research.

Objective 2: different stakeholder perspectives on perceptual brand equity (consumer, customer, employee, resident)

Perception-based brand equity is also measured from different perspectives, including general consumers (Lassar *et al.*, 1995; Netemeyer *et al.*, 2004), actual customers (Kim *et al.*, 2008; Lin *et al.*, 2015) and employees of the firm (Erkmen, 2018; King and Grace, 2009). Even though some researchers use consumer-based brand equity and customer-based brand equity interchangeably (Keller, 1993), customer-based brand equity (CBBE) focuses on actual customers of a brand while consumer-based brand equity (CBBE) is measured with general consumers. Hence, some customer-based brand equity studies include constructs such as satisfaction (Lee and Back, 2008, 2010) while the general consumer-based brand equity studies include constructs that consumers may assess with or without first-hand experience. Even though CBBE has been a popular concept of destination research, the perspectives of residents as a critical stakeholder is amiss, thus far. Thus, there is a need for studies comparing perceptual equity from the perspectives of consumers/customers to those of employees of firms, and those of residents or tourism practitioners in the destination context.

Objective 3: original definitions and measures of perceptual brand equity by Aaker and Keller

One of the initial discussions by Farquhar (1989) dubbed brand equity as the added value of a brand to the product and allows for flexibility on different perspectives of this added value. What guided most researchers, however, are the original conceptualizations of Aaker (1991, 1996) and Keller (1993, 2003). Keller (1993) used the customer-based brand equity term even though his definition referred to consumers in general. He defined CBBE as “the differential effect of brand knowledge on consumer response to the marketing of the brand” (1993, p. 2). His conceptualizations of brand equity boil it down to the overall concept of brand knowledge, composed of awareness and image. Aaker (1991), on the other hand, defined brand equity as a brand’s assets and liabilities without specifying it either consumer or customer-based. Afterward, Aaker (1996) proposed *The Brand Equity Ten Measures* including brand awareness, associations, perceived quality, loyalty and other proprietary assets as a practical departure point for developing a scale with cross-product and cross-market validity. He proposed that a change in one of the measures would cause a change in the financial-based brand equity measures such as prices, sales and profits. However, he acknowledged the potential use of a single summary metric for convenience in reporting and tracking purposes of companies. Although Aaker suggested that his measures have cross-product and cross-market

validity, he also acknowledged that his measures are not an optimum set, and thus some modifications may be needed to adapt to different product and market contexts.

Objective 4: deviations from the original conceptualizations and measures of perceptual brand equity by Aaker and Keller

The definitions and measures of CBBE provided by Aaker and Keller guided many empirical studies that conceptualized and measured CBBE for different product brands in different industries over the past two decades. However, the majority of studies reflect the framework of Aaker. [Table 1](#) displays the chronological development, and thus the cumulative nature of the CBBE components and their measures. As can be seen from the table, almost no researcher exactly followed either Aaker's or Keller's proposed CBBE structure. Some researchers deleted unfitting components such as proprietary brand assets, which are related to firms rather than consumer perception. Others added more pertinent components depending on their product and brand context. These differences reflect the divergence in both the conceptualization and operationalization of CBBE in the current literature.

The root cause of some of the additional components proposed by researchers who adopted Aaker's framework could be the multidimensional nature of some components. When [Aaker \(1996\) Brand Equity Ten Measures](#) are scrutinized, it is clear that only awareness was clearly defined while the dimensions of some components possess the properties of multiple concepts. He included price premium and satisfaction as dimensions of loyalty; included leadership as a dimension of the perceived quality; and included perceived value, brand personality and organizational associations (organization and differentiation) as dimensions of the associations/differentiation component. Thus, some of these dimensions were later added as distinct components, value and price premium are such additions ([Lassar et al., 1995](#); [Netemeyer et al., 2004](#); [Tasci, 2016a, 2016b, 2016c, 2018, 2020](#)).

Second, some researchers renamed Aaker's original components. For example, [Yoo and Donthu \(2001\)](#) used Aaker's model; however, they also included Overall Brand Equity, which was operationalized similar to loyalty (e.g. "if there is another brand as good as X, I prefer to buy X"). These scales were also adopted by others ([Washburn and Plank, 2002](#); [Washburn et al., 2000](#)). Similar overall brand equity conceptualizations that resemble loyalty or willingness to pay are still applied in tourism and hospitality. For example, [So and King \(2010\)](#) measured customer-based hotel brand equity by using typical loyalty items: "makes sense to use this hotel instead of other," "prefer to use this hotel even have same features," "prefer to use this hotel if another is as good," "seems smarter to use this hotel if another is not different." Other researchers also measured brand equity with these items ([Rodríguez-Molina et al., 2019](#); [Rodríguez-López et al., 2020](#); [Seric et al., 2016](#); [Seric et al., 2017](#); [Šerić and Gil-Saura, 2019](#)). [Sijoria et al. \(2019\)](#), on the other hand, measured brand equity with items that are usually used to measure loyalty and willingness to pay ("the price of hotel X would have to go up quite a bit before I would switch to another brand of the hotel; I am willing to pay a higher price for hotel X than for another hotel; I am willing to pay ___per cent more for hotel X over other hotels: 0% 5% 10% 15% 20% 25% 30% or more; Hotel Y would have to be ___per cent per cent less than Hotel X before I would switch brands: 0% 5% 10% 15% 20% 25% 30% or more.").

Third, some researchers modified the existing components after testing Aaker's original framework. For example, [Atilgan et al.'s \(2009\)](#) study included awareness, associations, quality and loyalty; however, they revealed a new dimension of brand trust to replace

Table 1.

Notes: The numbers reflect the number of dimensions retained after purification of scales. X is placed for conceptual studies and studies where the number of scale items is not clarified

awareness. In a conceptual study, [Xu and Chan \(2010\)](#) conceptualized CBBE in the hotel context where they replaced brand quality with quality of experience.

Fourth, other researchers introduced new components to the CBBE framework that were not originally introduced by neither Aaker nor Keller such as, sustainability ([Baalbaki, 2012](#)), attachment ([Lassar *et al.*, 1995](#)) management trust, brand reliability ([Hsu *et al.*, 2012](#)), quality of experience ([Xu and Chan, 2010](#)), uniqueness ([Lin *et al.*, 2015](#); [Netemeyer *et al.*, 2004](#)); personnel behavior ([Sürücü *et al.*, 2019](#)); brand meaning ([Sarker *et al.*, 2019](#)) and brand engagement ([Huerta-Álvarez *et al.*, 2020](#)) to name a few. For example, in testing the CBBE of luxury hotels for customers, [Hsu *et al.* \(2012\)](#) included quality, awareness, image, loyalty and new components of management trust, brand reliability. Similarly, [Lin *et al.* \(2015\)](#) included uniqueness in customer-based brand equity of hotel brands. Some researchers revealed CBBE components that are completely different from both Aaker's and Keller's. For example, [Christodoulides *et al.* \(2007\)](#) revealed in their qualitative research studying online retail service brands that CBBE included online experience, emotional connection, responsive service nature, fulfillment and trust.

Fifth, even when researchers used the original components of Aaker and Keller, the number of dimensions in each component was different due to differences in product

features. For example, [Gordon \(2010\)](#) used [Keller's \(2003\)](#) pyramid with the layers of brand awareness, brand associations, brand effect, brand superiority and brand resonance; the study results showed different scale items for different CBBE components in product versus service contexts. Similarly, [Kim and Kim \(2005\)](#) applied Aaker's model and revealed a slight difference in the number of quality items for luxury hotels versus chain restaurant contexts.

Sixth, some researchers regrouped some brand equity components into a different concept. For example, [So and King \(2010\)](#) included brand awareness, associations, personality and perceived value components and regrouped associations, personality and value as a second-order factor named brand meaning. [Sarker et al. \(2019\)](#) also used the same concept in their conceptual study.

These modifications resulted in a CBBE construct with about 40 components, measured by single item or multi-item scales including up to 22 items in the current CBBE literature (see the number of components and scale items in [Table 1](#)). [Aaker \(1996\)](#) foresaw such deviations due to the relevance of different components for different brands and different market segments. Such additional or new components may be relevant and necessary due to the unique nature of different product contexts, especially the tourism and hospitality products as opposed to conventional products; however, the relevance and necessity need to be justified by the researchers.

Objective 5: evolution of the five most common perceptual brand equity components

Despite deviations from the original CBBE conceptualizations, a majority of studies included the components of brand familiarity/brand awareness, brand image/brand associations, perceived quality, consumer value/perceived value and brand loyalty/consumer loyalty/customer loyalty in measuring CBBE. These components are concepts that appeared before the emergence of CBBE. The conceptual evolution of these most commonly used components of CBBE is discussed next.

1. Brand familiarity/brand awareness

Both awareness and familiarity have been used as a component of CBBE. The familiarity concept has been studied before the emergence of CBBE. Defined as consumers' level of experience and knowledge with a brand, familiarity has been acknowledged to have an important role on many consumer behavior variables ([Alba and Hutchinson, 1987](#); [Burch, 1969](#); [Bettman and Park, 1980](#); [Johnson and Russo, 1984](#); [Park and Lessig, 1981](#); [Punj and Staelin, 1983](#); [Tasci and Knutson, 2004](#); [Tasci and Boylu, 2010](#); [Zaichkowsky, 1985](#)). Consumers' high level of familiarity is expected to ease consumers' processing of information, reduce risk and uncertainty and induce positive affect toward an object ([Burch, 1969](#); [Tasci and Knutson, 2004](#); [Tasci and Boylu, 2010](#)). Destination image research reports a positive influence of familiarity on the image as well ([Baloglu, 2001](#); [Chen and Lin, 2012](#); [Prentice, 2004](#); [Prentice and Andersen, 2000](#); [Sonmez and Graefe, 1998](#)).

Initially, Aaker and Keller considered brand awareness as a distinct CBBE component and agreed on the role of brand awareness as the launchpad for building the other components. [Aaker \(1991\)](#) defined awareness as "the ability of a potential buyer to recognize or recall that a brand is a member of a certain product category" (p. 61). Keller's initial CBBE proposition stated that "(c)ustomer-based brand equity occurs when the consumer is familiar with the brand and holds some favorable, strong and unique brand associations in memory" (1993, p. 1). Aaker and Keller operationalized awareness as consumers' top-of-mind awareness and their ability to recall/recognize and distinguish one brand among other brands ([Aaker, 1996](#); [Keller, 2003](#)). [Aaker \(1996\)](#) suggested four items to measure brand

awareness in *Brand Equity Ten Measures*. Despite its importance, Aaker also cautioned about the nature of awareness when focusing on specific brand elements such as name, symbols and imagery in measurement and also the difficulty of comparing awareness across different brands and products (1996, p. 115).

Most researchers followed suit and used awareness as a distinct brand equity element influencing one or more of other components. However, there are also different practices regarding the awareness component. Table 1 reflects that some researchers measured this component with multi-item scales while others used one-item scales. Some researchers combined awareness with associations (Roth *et al.*, 2008; Washburn and Plank, 2002; Washburn *et al.*, 2000; Yoo and Donthu, 1997, 2001; Yoo, Donthu and Lee, 2000). The practice of combining brand awareness with associations threatens the integrity of these components that are apparently distinct from one another when operationalized correctly. Hence, Washburn and Plank (2002) recognized the need to separate them in future research for refinement to comply with the theory.

Although Keller (1993) used awareness in his initial design of the CBBE components, his later work in 2003 replaced awareness with salience, which formed the base to build on the other components, namely, performance, imagery, judgments, feelings and resonance. Following this practice, Pike *et al.* (2010) also used brand salience in destination brand context; hence, a semantic analysis of scale items reveals much resemblance to awareness and associations (e.g. “this destination is very famous”).

Another group of researchers preferred using familiarity instead of awareness (Denizci-Guillet and Tasci, 2010a, 2010b; Gartner *et al.*, 2007; Krishnan and Hartline, 2001; Tasci, 2016a, 2016b, 2016c, 2018; Tasci and Denizci, 2009; Tasci and Denizci-Guillet, 2011, 2016). For example, Gartner *et al.* (2007) included familiarity in their destination CBBE measures by operationalizing it as a categorical variable where they assessed visitation, hearing about or not knowing about different tourist sites with different levels of popularity. Similarly, Tasci and Denizci-Guillet (2016) used familiarity to capture varying degrees of awareness about brands and revealed that it is a critical factor of consumers’ judgments on the fit and compatibility of brands. Some researchers also used both awareness and familiarity in their brand equity conceptualizations (Horng *et al.*, 2012; Tasci, 2011); however, this may lead to redundancy especially in complex model testing due to the inherent relationship between awareness and familiarity.

Other researchers used “familiarity” in their scale items even if they named the component as awareness. For example, Rajh’s (2002) awareness dimensions included “this brand is very familiar to me” and “the characteristics of this brand are unfamiliar to me”. Similarly, Wang and Finn (2013) used familiarity as dimensions in their awareness component: “heard of it”, “heard of but never used it”, “heard of and used it”, “presently using”. Other researchers mentioned familiarity in explaining the role of awareness. For example, Lee and Back (2008) recognized familiarity as the incremental levels of awareness that leads to brand satisfaction through brand familiarity in the event context. Familiarity replacing awareness or being included in it may be justified with the inherent relevance of awareness to familiarity.

2. Brand image/brand associations

The image concept has surfaced about four decades before CBBE was conceptualized. The brand image concept first appeared as an important marketing metric in the general brand context in the 50s (Gardner and Levy, 1955; Newman, 1957) and made its way into the destination brand context in the 70s (Crompton, 1979; Hunt, 1975). Destination image, in particular, has been well-studied and modeled for its meanings, measurements, antecedents and consequences (Echtner and Ritchie, 1991; Tasci and Gartner, 2007; Tasci *et al.*, 2007).

Many destination image researchers included both quality and value as destination image attributes (e.g. quality of services, value for money). Maybe due to this precedence of the image, it was the preferred term in later CBBE studies even though Aaker's and Keller's original CBBE frameworks included associations.

Aaker (1991) conceptualized brand associations as "anything linked to the memory of a brand" (p. 109). In his *Brand Equity Ten Measures*, Aaker (1996) included 10 items measuring associations/differentiation with the dimensions of perceived value, personality, organization and differentiation. Some researchers considered consumers to value a distinct CBBE component (Boo *et al.*, 2009; Buil *et al.*, 2008; Lee and Back, 2008, 2010; Netemeyer *et al.*, 2004; Tasci *et al.*, 2018).

Keller's (1993) CBBE model also included brand associations, specifically types (benefits, attributes and attitudes), favorability, strength and uniqueness. However, he titled this component as "image." As can be seen from Table 1, most researchers adopted the associations component while many researchers used the image in tourism and hospitality (Bianchi *et al.*, 2014; Boo *et al.*, 2009; Frias Jamilena *et al.*, 2017; Horng *et al.*, 2012; Hsu *et al.*, 2012; Huerta-Álvarez *et al.*, 2020; Hyun and Kim, 2011; Kim and Kim, 2004, 2005; Kim *et al.*, 2003; Liu *et al.*, 2015; Martínez and Nishiyama, 2017; Oh and Hsu, 2014; San Martín *et al.*, 2018; Seric and Gil-Saura, 2012; Seric *et al.*, 2014; Sürücü *et al.*, 2019; Tasci, 2016a, 2016b, 2016c; Tasci and Denizci-Guillet, 2011, 2016; Yang *et al.*, 2015). Furthermore, some researchers included both images and associations in their CBBE models. Tasci (2016b), for example, recognized the similarities between associations and image concepts and used them interchangeably. Some researchers also separated images into cognitive and affective dimensions (Duman *et al.*, 2018). Table 1 reflects the combined number of image dimensions in such studies. Table 1 reflects that the number of items included in the image component is far more than the items included in the associations component, especially when the study context is multifaceted such as destination brands.

3. Perceived quality

Perceived quality was also defined and measured before the emergence of the CBBE framework. A majority of research on the quality concept revolved around perceived quality, mostly in the context of service quality which was defined by many different dimensions including consistency, security, completeness, attitude, availability, condition and training of service providers (Sasser *et al.*, 1978), willingness and ability to serve and physical and psychological access (Hedvall and Paltschik, 1989), technical, functional and reputational quality (Grönroos, 1984), interactive, physical and corporate quality (Lehtinen and Lehtinen, 1982), internal organization, corporate image, staff-customer interaction, physical support of the service system and customer satisfaction (Leblanc and Nguyen, 1988). Parasuraman *et al.* (1985, 1988) defined it as five dimensions of reliability, tangibles, responsiveness, assurance and empathy (SERVQUAL), which received the most attention, acceptance and critiques from researchers. In another stream of research, the perceived quality was considered as a dimension of consumer value (Gallarza and Saura, 2006; Holbrook, 1994, 1999; Lapierre, 2000; Lee *et al.*, 2007; McDougall and Levesque, 2000; Patterson and Spreng, 1997; Petrick, 2002; Sanchez *et al.*, 2006; Sweeney and Soutar, 2001; Zeithaml, 1988). Tasci (2016a) considered including quality as a dimension of value as a threat to the integrity of these constructs and their relationship in the CBBE framework, and thus recommended separating them as distinct concepts.

In his CBBE framework, Aaker quoted Zeithaml (1988) in defining perceived quality as "the consumer's judgment about a product's overall excellence or superiority" (1991, p. 85). In his *Brand Equity Ten Measures*, he included six items reflecting dimensions of perceived

quality and leadership. The leadership dimension was later considered a distinct CBBE component (Baalbaki, 2012). Keller (1993), on the other hand, considered perceived quality as a brand association dimension rather than a distinct component.

As can be seen from Table 1, almost all researchers included quality as a dimension of the CBBE framework by including different quality attributes depending on the nature of the product under investigation. Some researchers kept Parasuraman *et al.*'s (1985, 1988) SERVQUAL dimensions (Lee and Back, 2008, 2010; Kayaman and Arasli, 2007). However, the validity of quality in the CBBE framework was not warranted in the results of some studies. For example, Boo *et al.*'s (2009) destination CBBE model initially included awareness, consumer value, image, perceived quality and brand loyalty as separate components. Because of the high levels of correlation between image and quality components, they pooled image and quality into another conglomerate component named destination brand experience. A similar issue was revealed in Tasci's (2018) CBBE model applied to multiple destination brands with single-item measures. Because of the high level of correlation between image and quality, she eliminated the quality component to stabilize the CBBE model fit in path analysis. Even though quality was included as a destination image dimension in many destination image studies, quality and image are commonly accepted as distinct components of CBBE (Tasci, 2016a); thus, future research needs to take measures to maintain their distinct nature in definition, as well as measurement.

4. Consumer value/perceived value

The value concept and its derivatives such as perceived value and consumer value have also emerged before the CBBE concept (Hirschman and Holbrook, 1982; Perry, 1926; Sewall, 1901; Zeithaml, 1988). Consumer value is the trade-off that consumers perceive between the benefits and costs of purchasing and consuming a product or brand (Zeithaml, 1988). Similar to perceived quality, consumer value also faced conceptual invasions.

The value was not considered as a distinct component in the original CBBE works of Aaker or Keller. Aaker (1996) considered the validity of consumer value as a distinct component questionable due to its inherent relation to perceived quality. Thus, Aaker (1996) formulated two measures of consumer value within brand associations in *Brand Equity Ten Measures*.

Table 1 shows that some CBBE studies in tourism and hospitality did not include consumer value in studying CBBE (Herrero *et al.*, 2017; Kashif *et al.*, 2015; Martinez and Nishiyama, 2017; Pike *et al.*, 2010; Vinh and Nga, 2015). On the other hand, following Aaker, some tourism and hospitality researchers measured consumer value (e.g. "reasonable price," "value for money," etc.) as a dimension of the image (Kim and Kim, 2004, 2005), a dimension of perceived quality (Konecnik and Gartner, 2007; Yuwo *et al.*, 2013; Zanfardini *et al.*, 2011) or brand performance (Prasad and Dev, 2000). Nonetheless, several tourism and hospitality researchers considered consumer value to be a distinct element of CBBE (Bianchi *et al.*, 2014; Boo *et al.*, 2009; Cano Guervos *et al.*, 2020; Lee and Back, 2008, 2010; Liu *et al.*, 2015; Pike and Bianchi, 2016; Tasci, 2016a, 2016b, 2016c, 2018; Tasci and Denizci-Guillet, 2011, 2016; Tasci *et al.*, 2018). Some researchers also coined terms such as "value in use" as a separate dimension of brand equity; for example, Chekalina *et al.* (2018) coined this term in destination context; however, they operationalized it similar to the destination image. Similar to the image, the meanings, measurements, antecedents and consequences of consumer value have been well-studied in many product contexts including hospitality and tourism brands (Tasci, 2016a). Thus, it merits being a distinct CBBE element rather than measured as a dimension of another element.

5. Brand loyalty/consumer loyalty/customer loyalty

Brand loyalty received academic attention about five decades before the emergence of the CBBE framework. Similar to other components of CBBE, consumer loyalty has also gone through a conceptual and operational identity crisis (Jacoby and Kyner, 1973). Hence, many different definitional and operational approaches exist in capturing consumer/brand loyalty (Brown, 1952; Jacoby, 1969; McConnell, 1968; Tucker, 1964). Past literature shows many different definitions and different operationalizations of consumer loyalty reflecting overt behavioral indicators related to past and future such as repeat purchase, intentions and positive word of mouth, as well as covert attitudinal indicators such as price sensitivity, preference and liking (Dick and Basu, 1994; Ganesh *et al.*, 2000; Gallarza and Saura, 2006; Garland and Gendall, 2004; Gounaris and Stathakopoulos, 2004; Oliver, 1999; Oppermann, 1998; Reichheld and Sasser, 1990; Shoemaker and Bowen, 2003; Tasci, 2016d; Yoon and Uysal, 2005). Some of these indicators have been used by researchers in capturing loyalty as an element of CBBE as well, even though the original CBBE frameworks by Aaker or Keller did not include these indicators.

Brand loyalty was not a distinct component of Keller's (1993) CBBE framework. Although Aaker's (1991) CBBE framework included brand loyalty as a distinct component, his original operationalization does not capture the behavioral and attitudinal nature of loyalty. He defined brand loyalty as "the attachment that a customer has to a brand" (1991, p. 39). However, in his *Brand Equity Ten Measures*, he defined loyalty by juxtaposing satisfaction and willingness to pay higher prices (price premium) with seven items reflecting these concepts. Some tourism and hospitality researchers followed suit and included either price premium, satisfaction or both as indicators of loyalty (Kayaman and Arasli, 2007; Kim and Kim, 2004), while most others confined loyalty within its dimensions only. Recently, Tasci (2016b, 2016c, 2018, 2020) included price premium as an indicator of "brand value" by narrowing it to premium price perception without involving the consumer's willingness to pay for it. Other studies also included brand value for CBBE of hotel and destination brands (Bailey and Ball, 2006; Denizci-Guillet and Tasci, 2010a, 2010b; Tasci, 2016b, 2018; Tasci *et al.*, 2018; Tasci and Denizci-Guillet, 2011, 2016).

The critical role of loyalty for the success of tourism and hospitality brands is evident in most studies that included loyalty in CBBE, even though a few researchers named it as brand equity in their studies (Rodríguez-López *et al.*, 2020; Rodríguez-Molina *et al.*, 2019; Seric *et al.*, 2016; Seric *et al.*, 2017; Šerić and Gil-Saura, 2019; Sijoria *et al.*, 2019; So and King, 2010). Another confusion comes from switching between Aaker's and Keller's conceptualizations of CBBE. For example, Duman *et al.* (2018) followed the brand equity model of Keller and used brand resonance as a component of CBBE, which they measured with behavioral loyalty and attitudinal attachment. Yet another stream of research also included loyalty and other ramifications of it as either another component of CBBE or as an outcome of loyalty. For example, Oh and Hsu (2014) included both brand loyalty and brand choice intention as separate components of CBBE, even though all dimensions included in both resemble the indicators of loyalty. Similarly, Lu *et al.* (2015) also included both brand loyalty and brand choice intention in their studies; however, they kept loyalty as the CBBE component, which consequently affected brand choice intention as an outcome variable. Splitting loyalty into different types (i.e. past vs future attitudinal vs behavioral) and treating different loyalty types as both a component and an outcome of CBBE may cause conceptual confusion besides potential discriminant validity issues.

Objective 6: structural relationships of the most common perceptual brand equity components

Aaker's (1996) CBBE conceptualization and measures did not suggest any particular relationship among the components. He implied that awareness is the main culprit affecting all the others, as it influences perceptions and attitudes. However, Keller's (2003) conceptual

model constructed a CBBE pyramid, the base being brand salience, supporting brand performance and imagery; brand performance defining the next layer of brand judgments, imagery defining consumer effect, all collectively defining consumer-brand resonance on top. However, this model is rather conceptual, without operationally clear or directional relations among components.

Researchers following both Aaker and Keller revealed diverse structural relations among CBBE components with almost no consistency in the type of components or their relationships. Some tourism and hospitality researchers considered loyalty as a CBBE outcome (Lin *et al.*, 2015). On the other hand, others included loyalty as a CBBE component (Boo *et al.*, 2009; Dedeoglu *et al.*, 2019; Hsu *et al.*, 2012; Kashif *et al.*, 2015; Lee and Back, 2008; Liu *et al.*, 2015; Lu *et al.*, 2015; Oh and Hsu, 2014; Seric *et al.*, 2014; Tasci, 2018; Vinh and Nga, 2015). For example, Hsu *et al.* (2012) included brand loyalty as a CBBE component and brand choice intention as the outcome of CBBE, where all components influence brand loyalty and brand loyalty influences brand choice intention.

In a literature review of the value construct and its role in the CBBE framework, Tasci (2016a) proposed a CBBE model with awareness as the launchpad component and loyalty as the outcome component dependent on the interrelations of image/associations, quality and value as perception and willingness to pay higher prices. However, in testing a CBBE model's cross-brand validity, Tasci (2018) found that familiarity and image had the most effects in the path model, familiarity influencing not only the image but also consumer value and loyalty for both general consumer and customer groups and eventually having the most explanatory power on loyalty.

A few researchers proposed measuring CBBE with its distinct components and an overall brand equity component (Buil *et al.*, 2013; Yoo and Donthu, 2001). In their conceptual model of CBBE for hotels based on a review of literature, Xu and Chan (2010) included an overall brand equity concept that is influenced by loyalty, brand awareness, brand associations and quality of experience. Similarly, Buil *et al.* (2013) included brand awareness, perceived quality, brand associations and brand loyalty as the components of brand equity. They also added a 3-item overall brand equity concept which was influenced by brand loyalty and in return, influenced willingness to pay a price premium, brand extension, brand preference and purchase intention. However, the similarity of the items in loyalty, overall brand equity, willingness to pay a price premium, brand extension, brand preference and purchase intention implies issues of discriminant validity.

Loyalty needs to be treated as a component of CBBE by distinguishing it from other outcome variables that may be included in studies. The use of additional components that resemble loyalty or the general brand equity may cause redundancy in structural or path models. Hence, such practices need theoretical justification, rigorous methods and robust results, besides transparency in pertinent validity measures for the reader to make the ultimate judgment.

Discussion and conclusions

Conclusions

Brand equity with both financial and perceptual dimensions has been a focus of research for the past 30 years. As perceptual equity was commonly considered a proxy for financial equity, many studies tested the strength and relations of some perceptual indicators in several product contexts including hospitality and tourism. The review of literature on CBBE, however, reveals that both components and their interrelations are defined and measured in many different ways in different product and brand context, even though most CBBE research is guided with the positivist paradigm that requires standardization in

concepts, methods, tools, and measures (Kuhn, 2012). Although using different components may be logical in different product contexts, some level of standardization is needed for robust theory development and practical implications, especially when measuring CBBE for the brands of the same product category. Toward such standardization, this study suggests using uniform CBBE components, measures and model relationships in future research. Brand familiarity/brand awareness, brand image/brand associations, perceived quality, consumer value and brand loyalty are the most commonly used components of CBBE; maybe because they have been already established concepts studied before the emergence of CBBE as a conglomerate concept in the early 90 s. These components and their relationships can be measured to identify the presumed relationship between CBBE and FBBE, as well as compare CBBE from different stakeholder perspectives, especially by including residents in destination studies. These suggestions, as Objective 7 of the study, are discussed below.

Theoretical implications (Objective 7: conceptual, structural, relational and methodological suggestions for future research)

Despite three-decade-long research on brand equity and CBBE, there is more to do to fine-tune, adjust and better understand this construct in future research. First, researchers need to use a uniform CBBE framework with similar measurement items rather than inventing new CBBE components and diluting the concept. The parsimonious five-component structure and the template measurement scales suggested in this study may help establish a more connected theory of CBBE even if it is applied in different contexts.

Using uniform perceptual brand equity components and measures

Keeping in mind the most commonly used components, this study offers a comprehensive yet parsimonious definition of CBBE: *CBBE is a brand's intangible strength manifested in consumers' level of familiarity with the brand guiding their cognition, affect and behavior in the form of image, quality, value and loyalty related to the brand.* This definition integrates the most commonly used components of CBBE and, thus, enables a standard measure of it to allow cumulative theory development on this concept and ability to assess its relationship to other constructs. Although many of the newly added CBBE components in Table 1 are potentially meaningful indicators of the success of a brand in different contexts, trying to measure the CBBE construct with as many components as displayed in Table 1 would possess neither scientific parsimony nor practicality. Comprehensive, yet practical, the capture of CBBE requires measurement of the commonly used components, including familiarity/awareness, image/associations, perceived value/consumer value, perceived quality and brand loyalty/consumer loyalty.

Table 2 suggests a parsimonious list of measures as a guide to measuring these components in future research, with both single and multi-item scales in destination, hotel and restaurant contexts, which can be modified to other contexts accordingly. These measures need to be interpreted as a framework similar to Aaker's (1996) *Brand Equity Ten Measures*. As tourism and hospitality products are a conglomerate of physical and service components, some CBBE components (awareness, image, quality and value) are formulated as formative scales reflecting different product features. However, reflective items referring to the product in general can also be used. In designing the scale items of image, quality and value, caution is needed to differentiate them substantially. Similar verbiage of scale items may cause unstable structural or path modeling results, as was the case in Boo *et al.*'s (2009) and Tasci's (2018) studies. For loyalty, both past and future behavioral dimensions, as well as the attitudinal dimension of loyalty are included as a guide for future research. In the measurement of these components, attention is needed to choose between awareness and

CBBE component	Scales (stated for agreement anchors – 1 = strongly disagree, 2 = disagree very much, 3 = disagree, 4 = neither disagree nor agree, 5 = agree, 6 = agree very much, 7 = strongly agree)		
	Destination context	Hotel context	Restaurant context

Table 2.

familiarity, as well as associations and image, while also distinguishing value, quality and brand loyalty from other concepts as explained below.

Choice of brand familiarity or brand awareness

Even though awareness was the original Launchpad component of CBBE, awareness in the context of popular tourism destinations or well-known hotel brands may be a granted situation; what differentiates between competing popular tourist destinations or brands may be the level of familiarity sourcing from different information agents. Familiarity as the launchpad component of CBBE may provide a few advantages. First, it may be easier to

design a single-item or multi-item familiarity scale. Second, it is possible to also capture different sources of familiarity in scales. Consumers may have informational familiarity from written, audio and visual sources (Baloglu, 2001; Prentice, 2004; Sharifpour *et al.*, 2014; Zaichkowsky, 1985) or experiential familiarity from actual experiences with an object (Baloglu, 2001; Prentice, 2004; Zaichkowsky, 1985), which can be captured by multi-item scales. Third, familiarity may provide a wider variance in measurement scales as consumers' varying degrees of knowledge and experience can be captured with more continuous scales rather than Aaker's (1996) original Yes/No type questions (i.e. "have you heard of this brand?"). Fourth, familiarity may overcome the issues of awareness that Aaker (1996) raised; it may enable measurement of consumer familiarity in general rather than specific brand elements and allow comparison across different products and brands. Finally, due to its well-established connections with other constructs, familiarity may be a better fitting component of CBBE than awareness in some brand contexts such as destinations.

Choice of brand image or brand associations

Associations are the nodes of information in consumers' memory about the brand-related attributes, benefits and emotions that shape consumers' behavior toward the brand (Aaker, 1991, 1992, 1996; Keller, 1993, 2003). Even though associations can be used interchangeably with image, especially in conceptual discussions to allow the flexibility of choice for different measurement contexts, in empirical studies, uniform use of one or the other may provide more standardization of methodology and robust theory development. Image may be a better fitting construct due to existing well-established theory in certain contexts such as destinations where its meanings, measurements, antecedents and consequences have been well-studied and modeled since the 70s.

The distinction between perceived quality and consumer value

As relatively well-defined and measured concepts, perceived quality and value need to be integrated as distinct components of CBBE rather than as dimensions of the other components. Distinguishing perceived quality as a separate component fine-tunes the elements of the CBBE construct with meaningfully different dimensions that are known to influence consumer behavior. Although the majority of researchers already follow this practice, some researchers combine quality with another component or eliminate it due to high correlations with an image (Boo *et al.*, 2009; Tasci, 2018). As was also suggested by Tasci (2018), researchers need to carefully design scale items to assure the integrity of individual constructs for better theory development. Similarly, the distinction of value is also critical particularly in brand contexts where products and services pose risk, uncertainty, and thus, perceived benefits and costs that may hinge on the overall CBBE of a brand. For example, the destination brand context poses several risks, especially for distant destinations, where consumers' perception of quality and their loyalty tendencies may heavily depend on the potential costs due to the foreseen or unforeseen risks. Therefore, consumer value needs to be a distinct component of CBBE in such contexts.

The distinction between brand loyalty and price premium

Aaker's (1996) conceptualization of loyalty by combining satisfaction and price premium not only misses the overt and covert indicators of loyalty but also invades satisfaction, another concept that is commonly accepted as a distinct construct. Additionally, using price premium as a dimension of loyalty may be a disservice to the integrity of the CBBE framework. When price premium is conceptualized as the actual price of a brand compared to actual prices of competitor brands, it comprises an FBBE component. However, when it is conceptualized from

a consumer perspective in terms of perceived price, it may be considered as part of CBBE. Nonetheless, loyalty needs to reflect both attitudinal and behavioral indicators of loyalty for a comprehensive capture of the construct when multi-item scales are used.

Using a uniform structural model

Using different relational models is an obstacle to the development of a robust CBBE theory. The relational structure of components needs to be modeled in line with the findings of past literature. The model displayed in Figure 2 is suggested based on the most commonly studied components in literature. First, brand familiarity/awareness is accepted as a priori to all other components of CBBE (Aaker, 1991, 1996; Keller, 1993). In fact, in some contexts, familiarity may have substantial influences on multiple components as discovered by Tasci (2018) in destination context where familiarity influenced image, consumer value and loyalty for both general consumer and customer groups, and thus, have the most explanatory power on loyalty. Second, image literature also suggests that, in some contexts, the brand image may have a substantial impact on other components. In the destination context, for example, there is a consensus on the destination image's influence on consumer behavior before, during and after visiting a place (Tasci and Gartner, 2007). While validating a CBBE model for multiple destination brands, Tasci (2018) discovered that familiarity influenced image, which then influenced all other components. Third, consumer value literature considers value as a perception of a tradeoff between price and quality of a brand; hence, quality influences consumer value (Gallarza and Saura, 2006; Kuo *et al.*, 2009; Oh, 1999; Petrick, 2004; Zeithaml, 1988). Fourth, several studies revealed a significant influence of consumer value and perceived quality on brand loyalty (Bianchi *et al.*, 2014; Chen and Chen, 2010; Hutchinson *et al.*, 2009; Hu *et al.*, 2009; Kuo, *et al.*, 2009; Lee *et al.*, 2007; Pike and Bianchi, 2016; Sanchez *et al.*, 2006). As brand loyalty was originally conceptualized as a component of CBBE rather than as an outcome, future studies need to follow this practice to allow robust theory development on the structural nature of CBBE. When financial metrics are involved, they can be integrated as the outcome of CBBE. The purpose is to standardize the CBBE model across different product and brand categories to allow assessment of the significance of CBBE in its relations to other concepts through and robust

Note: Author's assessment based on the literature

Figure 2.
A parsimonious
model of CBBE with
the most commonly-
used components

theory development on the structural nature of CBBE. When financial metrics (FBBE) are involved in CBBE studies, FBBE can be integrated as the outcome of CBBE.

The components and relationships displayed in this model agree with the commonly-accepted principles of robust theory development. First, aligned with the principles of the cumulative nature of science and degree of formal development (Shoemaker *et al.*, 2004), the model builds on previous studies and includes the most commonly-used concepts and their relational development identified in the literature. Second, following the principle of testability (Shoemaker *et al.*, 2004), the model clearly states the concepts and variables to be measured. Third, in line with the principle of falsifiability (Doty and Glick, 1994; Popper, 2005; Shoemaker *et al.*, 2004; Weber, 2012), the concepts and their relationships are specific enough to be disproved. Fourth, following the principle of scope or generalizability (Shoemaker *et al.*, 2004; Wacker, 1998), all the concepts and their relationships in the model apply to different situations, contexts and disciplines. Fifth, following the principle of parsimony, also termed as Occam's razor, simplicity, or efficiency (Shoemaker *et al.*, 2004; Popper, 2005), the model is the simplest explanation for the CBBE construct. Sixth, in line with the principle of importance (Weber, 2012), all the focal concepts have been the focus of scientific inquiry for decades. Seventh, the predictive power and explanatory power of the model (Shoemaker *et al.*, 2004; Kamps, 1999) can be tested using the measurement items in Table 2 as a guide in future studies.

Testing the presumed relationship between perceptual brand equity and financial brand equity

Brand equity studies have, thus, far focused on either financial or perceptual indicators. The critical role of CBBE can be solidified if its presumed influence on FBBE is established; therefore, future studies need to integrate components of CBBE with indicators of FBBE. A combination of both would provide a more comprehensive picture of brand equity, integrating perceptual and financial indicators. However, there are challenges to overcome in this endeavor. Although easy to calculate with real numbers, financial metrics have been questioned, as they are rather short-term-focused, static, don't apply to all marketing strategies and require a comparison with unbranded compatible products (Aaker, 1996; De Mortanges and Van Riel, 2003). These premises are problematic when applied to service and destination brand contexts. The lack of information on compatible unbranded products is a magnified shortcoming for some brands such as tourism destinations. First, information on compatible unbranded products is an unrealistic metric for the destination, as destinations are branded with certain names, symbols and flags. There is also a lack of compatible branded products; even if they offer similar products, all destinations are unique. Nevertheless, similarly popular tourist destinations of the same category or destinations with similar products can be used to compare both their CBBE and FBBE as relatively compatible brands. Another limitation is the lack of financial metrics against competitors in the destination context such as cash flow and price to benchmark. However, as suggested by Tasci and Denizci (2009), the number of visitors and revenues, the most commonly used economic impacts of tourism, can be used as objective financial metrics in the destination context. These financial indicators can be integrated into CBBE studies as a check on the productivity of CBBE. Testing the relationships between CBBE and FBBE empirically would enable researchers to confirm their assumption of strong CBBE leading to strong FBBE eventually. Additionally, connecting CBBE with FBBE allows linking separate streams of research for more holistic theory development as suggested by Tasci (2019).

Comparing different stakeholder perspectives on perceptual brand equity

More complete brand equity can be assessed by involving all different perspectives regarding a brand. Studies involving consumers reveal both the reality and purely imagined

perspectives of actual and potential consumers of a brand, while customer-oriented studies reveal the perception of the reality by the actual users. Employees as the internal customers of a brand may reveal more intimate and realistic perceptions than both consumers and customers. Thus, a comparison of these three different perspectives may reveal a comprehensive capture of the CBBE of a brand.

For conglomerate tourism products such as destinations, brand equity needs to be assessed from the perspectives of multiple stakeholders involved in both supply and demand side of the product. This is particularly critical for sustainable destination branding by strategically balancing between the host and guest perceptions, expectations and demands. Residents are both part of the destination product, as well as consumers of the several products and services involved in the destination. Brand equity from resident perspectives needs to be compared to those of visitors and tourism practitioners so that the mismatch or potential issues from different stakeholder perspectives can be identified. If, for example, resident-based CBBE is better than visitor-based CBBE, then there is a lack of promotion in the target markets; conversely, in the opposite case, there is a potential lack of resident support for tourism, thus calling for resident sentiment analysis. Furthermore, such comparative studies using the same measures and models can yield the importance of different CBBE components in explaining loyalty and other outcome variables from different perspectives. Is the relative influence of CBBE components on loyalty the same or different across different stakeholders? The current body of literature does not provide an answer to this question. Capturing all perspectives may not be feasible in one study; nonetheless, different studies focusing on different perspectives of the same brand would still provide useful comparisons of brands, especially when uniform components, measures and models are used.

Furthermore, the complexity of some brands such as destinations or places with diverse stakeholders may benefit from an interdisciplinary approach with collaboration, integration and hybridization of skills, expertise, knowledge, concepts, data, philosophies and methods from multiple disciplines (Darbellay and Stock, 2012; Leiper, 1981). Cross-fertilizations of ideas, concepts and methods from different fields related to destination brands such as geography, urban development, public policy and destination management may lead to more robust theory development.

Managerial implications

CBBE components and relationships displayed in Figure 2 are parsimonious for the industry practitioners to use in their marketing research and plans as a strategic market metric. Additionally, Table 2 offers a parsimonious and practical CBBE blueprint for practitioner use. The model and measures suggested in this study may encourage practitioners to conduct continuous monitoring of their own CBBE, as well as compare with their competitors' CBBE. As perceptual brand equity is becoming an important aspect of marketing for restaurants, hotels and destinations, these practical CBBE model and measures may become a common practice in the industry.

Limitations and future research

The current study focused on perceptual brand equity literature. Even though FBBE is briefly referenced in relation to CBBE, financial equity definitions and measures were not deeply analyzed. Thus, future studies need to delve into financial metrics of brand equity measures in hospitality and tourism product contexts such as hotels, restaurants and destinations. Nonetheless, this critical review provides a guideline for more robust theory development of the CBBE construct. Additionally, it offers a parsimonious and practical CBBE blueprint for the practitioners who include CBBE as a strategic market metric in

their marketing and research plans. Furthermore, it suggests standardization in CBBE research to enable systematic reviews with Meta-analysis of CBBE literature in the future. This critical review used a narrative analysis because a systematic review with Meta-analysis of CBBE literature is not possible due to the divergence in definitions, components, measures and models used to study CBBE. Meta-analysis applies objective formulas to summarize the “significance levels, effect size estimations and the analysis of variations in effect sizes” (Cooper *et al.*, 2019, p. 8) and requires standard application of definitions, measures and models. Using standard components, measures and relational models in CBBE research, as is suggested in this study, would allow Meta-analysis for a meaningful comparison of results between different brands, products and even industries, and thus allow assessment of the relative effect sizes of each CBBE component on one another and the explanatory power of CBBE in empirical research.
